

Faculty Mentor Feedback Form (Video Recording of Teaching)

Mentor: **Brent Znosko**

Participant: **Sharear Saon**

Date: **3-24-22**

The primary purpose of this form is to provide a provisional structure to the conversation between the mentor and the Certificate participant about the video recording of teaching. Answers to the questions should be provided by the mentor, and we encourage the mentor to ask these questions of the participant also, as part of a dialogue about teaching specific to the participant's experience and discipline. The participant will include this form with his/her final portfolio.

Note: Attending class in lieu of a video recording will not satisfy this portfolio requirement. The video is reviewed by the participant (i.e., watching themselves teach), providing a shared context for discussion and feedback. While this form is a required piece for the final portfolio, its content will not be evaluated.

Areas for specific formative feedback:

What did you notice about the instructor's plan, lecture or activity, and interactions with students?

Sharear conducted a review of Chapters 10 and 11 in preparation for an exam. So, the material was already seen by the students. Slides were provided by the instructor with a little condensing by Sharear. The material was related to Sharear's research, so he understood the material well. He spoke at a nice pace and with good volume. He also used the whiteboard, mostly to draw structures. He also asked the students several questions throughout his presentation (some were his own question and some were suggested by the instructor). He also paused to see if the students had any questions.

How do the things you noticed contribute to or distract from student learning in the class?

All of the things mentioned above contributed to student learning. In my opinion, I think Sharear presented the material as if it was the first time the students were seeing the material. Since this was a review, the presentation could have focused more on questions, practice problems, or a summary instead of going over most of the material again.

How does what you observed compare to general teaching practices in the discipline?

General practice in chemistry is lecture. Some instructors incorporate active learning activities during their lectures to get students more involved in the learning. If Sharear ever teaches a class, he may want to consider incorporating these activities. These may include (but are not limited to): think/pair/share, quizzes, clicker questions, case studies, solving problems, etc.

Additional comments:

Sharear did a great job on his presentation. It was obvious that he spent considerable time preparing. Could he spend this amount of time on every lecture if he was teaching a semester-long course?
